From: Marc Nolen, President
RE: Sustainability Statement

To our valued customers,

Dover Chemical Corporation is a leading producer of alkylphenols, chlorinated alkanes, polymer additives, liquid and solid antioxidants (including organophosphites), additives for industrial lubricants, metalworking, driveline, and oilfield applications. As part of our continued efforts to develop our sustainability program, we will be completing an EcoVadis assessment in December 2023. Our company is focused on measuring how we are performing with our efforts to protect the Environment, manage Ethics, build Sustainable Procurement and follow the standards to protect Labor & Human Rights. We plan on sharing the results with our customers and suppliers once the assessment is complete in early 2024.

Over the last 2 years, Dover has spent over four million dollars on projects focused on improving sustainability. These projects have been initiated to protect the environment and reduce scope 1, 2 and 3 emissions. Our Dover, Ohio site has also been successful in reducing VOC emissions by seventy-five percent over the last five years. Responsible sourcing initiatives have also been a focus for us over the past two years.

In addition, Dover Chemical is also in process of generating a baseline measurement of our carbon footprint. As part of this initiative, we have collected two years of data for 2021 and 2022. We are using the GRI's Product Life Cycle Accounting and Reporting Standard in this calculation. This emission data is being used to help build our sustainability strategy for the future. As we focus on carbon footprint reduction goals moving forward, we will be sharing this information through our website. It is Dover Chemical's intent to provide our stakeholders with the transparency required to share our sustainability strategy.

We hope this statement shows our commitment to building a sustainable future for Dover Chemical and its customers.

Marc A Nolen

Marc Nolen, President
